STARLEGENDS ADVENTURES

HRIS App Functionality Guide

A product overview for reviewers, stakeholders, and demonstration sessions

Purpose. This document explains the intended modules, user workflows, role-based access, and backend dependencies of the Starlegends HRIS app.

Implementation note. This guide describes functionality documented in the project source. It does not confirm that every backend migration, policy, cloud function, or production service is deployed and operational.

Project build recorded in the source guide: 1.0.8+11 · Android package: com.starlegends.hris

- **Payroll:** HR prepares/manages payroll → Finance reviews/advances it → Top Management releases it.
- **Leave:** Employee submits a request → authorized reviewers act according to the configured workflow and request state.
- **Attendance:** Time In → Time Out → Done Today. An early/under-time confirmation may appear if time out is below expected duration.
- **Employee records:** HR Admin and Super Admin can manage records; directory deletion is restricted to Super Admin.
- **Supabase:** authentication, HR records, database policies, storage, and realtime workflows. URL/key alone do not enable every module.
- **Database migrations:** required schemas and workflows must be applied to the intended Supabase project. Repository files do not prove deployment state.
- **Firebase:** supports remote push when configured; server-side delivery also needs the Supabase dispatcher and secrets.
- **Local fallback/sample data:** selected services can show local or sample content when backend configuration or data is missing. A populated UI is not proof of live production data.
- **Security:** production account provisioning should run through secured server-side/Edge Function logic; a service-role key must not be embedded in the Flutter client.
- The source guide records build 1.0.8+11 and Android package com.starlegends.hris.
- The project source describes Flutter UI support for Android, iOS, and web, but some features are platform-specific or unavailable on web.
- Messaging, push notifications, Trash operations, payroll, documents, and account administration depend on the applicable backend setup and migrations.
- The guide does not establish that production SQL migrations, secrets, Firebase/APNs configuration, permissions, accounts, or live data have been deployed and verified.
- Recruitment's applicant list is documented as development-only sample data; a full applicant-tracking workflow is not implemented.

1. App overview

Starlegends HRIS is a role-based Human Resources and employee operations app built with Flutter and Material 3. It brings together employee information, attendance, schedules, leave and HR requests, payroll, performance, company communications, documents, reporting, and administration.

The app can use Supabase for authentication and business data. Firebase Cloud Messaging supports remote push notifications when configured. Selected preferences and development fallbacks are stored locally.

The interface uses a green-led brand palette, configurable accent colors, light/dark themes, rounded cards and controls, status chips, icon-led actions, and role-sensitive navigation.

Typical user journey

Stage	What happens
1. Start	App initializes and displays the branded splash screen.
2. Sign in	User signs in, completes a required password change if prompted, or proceeds based on account state.
3. Dashboard	Role-sensitive summaries, shortcuts, attendance, announcements, notifications, and messages appear.
4. Use a module	User views, submits, reviews, approves, or updates records based on role and request state.
5. Sign out	The authenticated session ends; configured push-token handling may deactivate the device token.

Navigation includes Dashboard, Leave, Attendance, and Profile, plus a role-sensitive dashboard drawer, feature shortcuts, actionable notifications, and a central Settings area.

2. Main modules and functionality

Module	Documented functionality
Dashboard	Role-appropriate shortcuts and summaries such as attendance, announcements, notifications, and message counts. Some content refreshes periodically or through realtime updates.
Employee directory & profiles	Browse employee records and profiles. HR Admin and Super Admin can manage employee records; directory deletion is Super Admin-only. Some fields are restricted by role.
Attendance	View current status and history; use Time In, Time Out, then Done Today. Submit attendance adjustment requests. Schedule values can inform lateness and duration calculations.
Leave requests & approvals	Employees submit leave requests and track status/history. Authorized reviewers approve or reject according to the configured workflow and request state.
General HR requests	Submit requests, follow approval progress, and review status. Authorized approvers act according to request type and role.
Schedules	View weekly schedules and approved changes. Authorized administrators assign or update schedules; users can request schedule or day-off changes.
Payroll & payslips	Payroll preparation can use attendance, schedules, leave, employee and pay inputs. Workflow: HR prepares and submits to Finance; Finance advances to Top Management; Top Management releases.
Performance	Presents performance dashboard information and related records. Visibility is role-sensitive.
Reports & itinerary	Supports report submissions, review history, status updates, and reviewer actions such as processing or returning reports.
Documents	View and upload employee documents and assign required-document items. Requires the appropriate database and storage configuration.
Recruitment	Lists open positions and applicants. Job openings can be added. Applicant list is development-only sample data and empty in online mode; full applicant tracking is not implemented.
Company feed	View announcements and, where configured, attachments, reactions, comments, and replies. Authorized roles can create, edit, and delete announcements.
Notifications	View and mark notifications as read, open related actions, and move supported entries to Trash. Remote push is a separate configured service.
Messages & group chat	Direct and group chat, message history, read state, unread counts, attachments, and live updates where configured. Requires authenticated Supabase access; no local-only chat fallback.
Accounts & access	Super Admin manages system accounts. Production provisioning is intended to use secured Supabase Edge Functions, not a service-role key in the client.
Teams & settings	Manage teams and membership, personal preferences, profile/security actions, support, audit-log views, and supported Trash actions according to permissions.

Available actions can differ by account role, request state, screen-level rules, and backend Row Level Security (RLS) policies.

3. Roles and access model

The project defines eight roles. This summary highlights explicit rules documented in the source guide; it is not a complete permission matrix for every screen or database action.

Role	Highlights
Employee	Employee-facing records, attendance, requests, schedules, reports/itinerary, applicable payslips, and company communications.
Team Leader	Can participate in configured leave approvals, itinerary workflows, and permitted operational attendance tasks.
Department Head	Can participate in configured leave approvals, itinerary workflows, and permitted operational attendance tasks.
HR Admin	Can manage employee records, access administrative settings, participate in leave approvals, and prepare/manage payroll.
Finance	Reviews payroll after HR submits it and advances it through the documented approval flow.
Management	Included in administrative-settings access according to the permission helper; individual settings may be stricter.
Top Management	Receives the payroll workflow for final release; excluded from Performance by the permission helper.
Super Admin	Can manage system accounts and employee records; employee-directory deletion is Super Admin-only; excluded from Performance.

Important workflow examples

A visible navigation item does not guarantee permission to perform every action. Screen checks and backend policies can apply additional restrictions.

4. Settings and integrations

Area	Behavior and dependencies
Appearance	Light/dark mode and accent colors: Green, Blue, Red, Violet, Yellow, and Orange. Stored locally.
Notifications	Remote push requires Firebase setup plus Supabase push schema, dispatcher function, and server secrets.
Attendance reminders	Local reminders are scheduled two minutes before shift start/end for the next 14 days using Asia/Manila schedule time. Rest days and certain past/completed reminders are skipped. Not available on web.
Biometric login	Optional native-device authentication where supported and enabled; unavailable in web builds.
Profile & password	Profile details and editing are subject to role restrictions. Password update uses Supabase Auth when configured.
Help Center	Offers direct HR chat; requires backend recipient resolution and messaging setup.
Company setup	Links to Departments, Positions, Leave Types, Roles, Team Management, Audit Logs, Trash, and other role-limited settings.

Backend and production dependencies

5. Suggested demonstration walkthrough

Use this sequence when presenting the app to a reviewer. Demonstrate with test accounts and fictional data only.

Step	Screen	What to demonstrate
1	Sign in	Show the branded login flow and role-sensitive entry point.
2	Dashboard	Explain attendance summary, shortcuts, announcements, notifications, and message counts.
3	Attendance	Show Time In/Time Out, history, and how adjustment requests are initiated.
4	Employee directory	Open a profile and explain which editing actions are role-restricted.
5	Leave & HR requests	Submit a test request and show its pending status and review flow.
6	Payroll	Explain the HR → Finance → Top Management sequence using sample records.
7	Feed & notifications	Show company updates and opening a related action.
8	Settings	Show appearance, reminders, profile/security options, and role-limited administration.

6. Scope and verification notes

This guide uses the supplied app functionality reference and the updated preview image provided for the cover. It describes documented/intended behavior; it does not independently test the running app or verify production infrastructure.

Prepared for: Starlegends Adventures app review
Document type: Functionality overview and demonstration guide
Data handling: Use fictional/demo data for presentations; do not include real employee credentials, personal records, or payroll information.

End of guide
